Qualified Person and Disclosure Statement

Scott Heffernan, M.Sc., P.Geo., the Company's EVP Exploration and Qualified Person under National Instrument 43-101, has reviewed and verified that the technical information contained in this news release is accurate and approves the written disclosure of the same. Drill composites were calculated using cut-off values of 0.2 g/t, 1.2 g/t or 5.0 g/t gold as specified in the drill table and contain no more than ~5 metres (15 feet) of internal waste. Drill intersections are calculated using uncut assays and are reported as drilled thicknesses. All samples were submitted to Inspectorate Labs in Reno, Nevada for sample preparation. Sample pulps were then sent to Sparks, Nevada for geochemical analysis for gold by fire assay of a 30-gram charge with an Atomic Absorption finish (AA). Samples with AA gold values over 10.0 g/t were re-assayed by Screen Metallica fire assay. Surface samples are collected using a portable gas-powered rock saw and submitted for gold by fire assay of a 30-gram charge, and a multi-element geochemical suite of 53 elements by aqua regia digestion and analysis by Inductively-Coupled Mass Spectrometry (ICP-MS). Control samples (accredited standards, blanks and duplicate samples at the field and preparation stages) were inserted on a regular basis. Results were monitored upon receipt of assays.
